

EFFICIENT SYSTEMS INTEGRATION:

- > Common framework for integrating and synchronizing various applications with different systems across the organization
- > Transparent way to operate with even the most adamant external systems
- > Minimization of business process interruption
- > Reduces costs and empowers creativity by enabling admins and developers to create their own interfaces and amend existing applications with little or no coding
- > Reduces the operational risk of the firm

iServe

REDUCE YOUR OPERATIONAL RISK

In the recent years where the Fintech industry thrives, there is a rising demand from the financial institutions for robust applications to support each and every line of their operation. Advanced financial software or cloud-based systems form a major component in the development of an efficient and cost-effective framework that spreads out to cover from back-office to even client facing departments' requirements.

Key Features

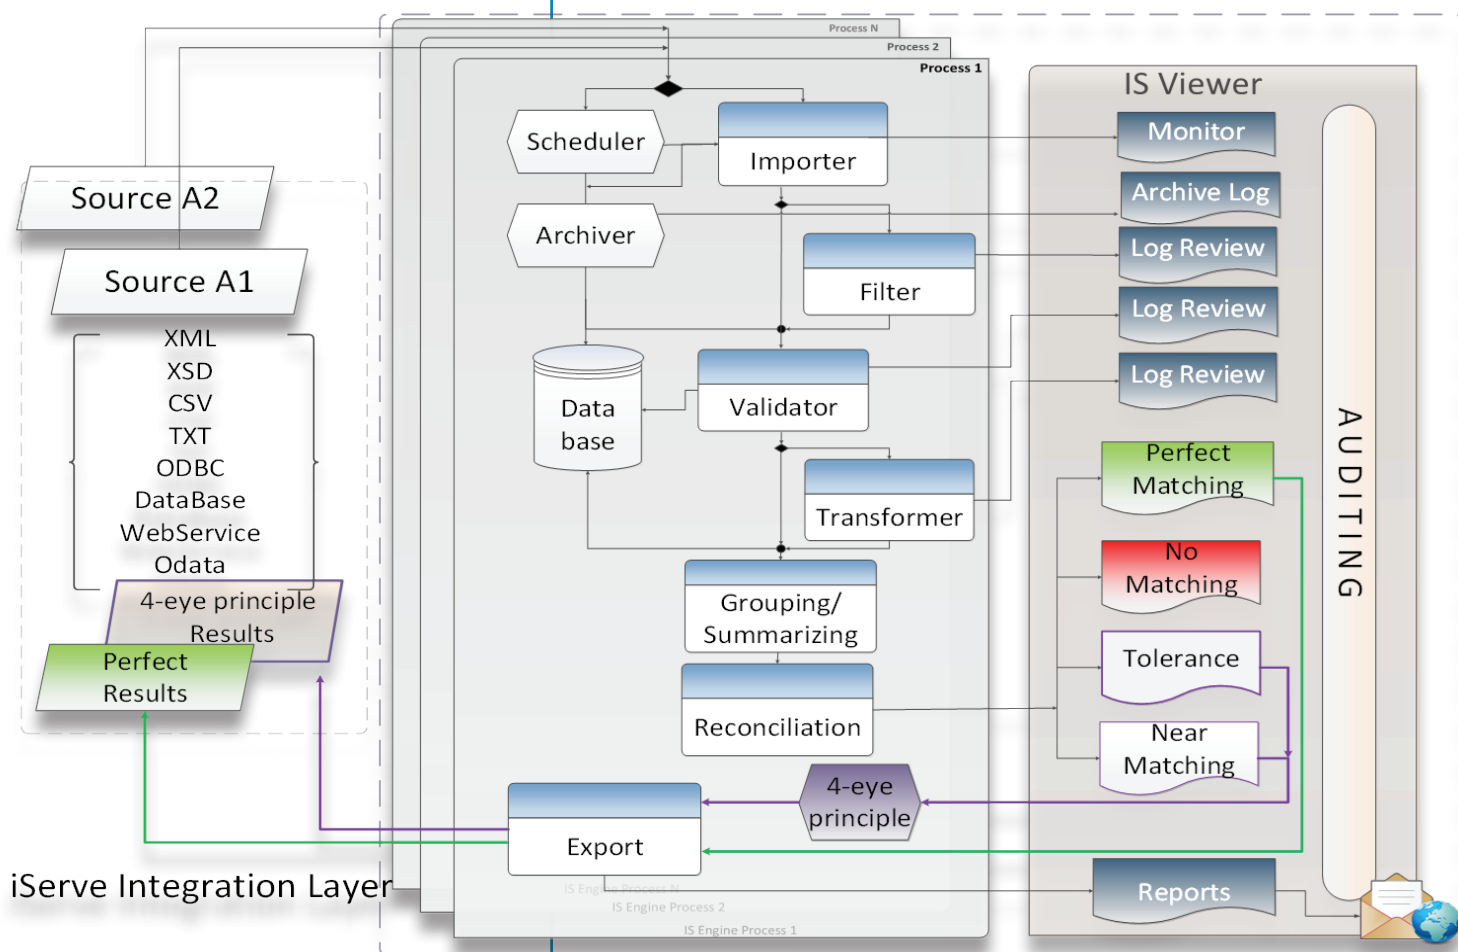

- > **Scheduler:**
 - Business Logic, Validity Periods
 - Triggers to activate events
 - Multiple Schedules
 - Holidays & Business Days Integration
- > **Filter – Validate – Transform - Export:**
 - Custom data-filtering rules
 - Custom data-validation rules
 - Custom data transformation rules
 - Export to a variety of data formats and connection types
- > **Reconciliation – Auditing:**
 - Reconcile the outputs between two or more systems
 - Determine differences based on smart criteria
 - Implement your own custom rules
 - Parametrize the reconciliation process
 - Maintain a comprehensive audit function

The wide range of such system offerings has lead though to the need of a solution to bridge them together. The advantages that each one of the systems bring to the firm individually will, with high certainty, be vanished if there is no connection between them. Therefore, the operational risk at the enterprise level increases significantly. Klarity Risk recognizes this demand and provides a comprehensive solution for systems integration within your firm.
